Fast & free estimates

Advanced Tree is licensed & insured so things like this will never happen.

of employee quality, and more in order to meet the demands of the industry with a high degree of safety in a very dangerous environment. Many landscape companies attempt to wear the label of Tree Removal Company and are only insured for landscaping challenges.

Tree Removal

Tree removal should be handled by reputable professionals. We follow the standards set by the **International Society of Arboriculture** to ensure that each job runs safely and efficiently. **Advanced Tree, Inc.** has up-to-date equipment, experience, and the expertise to remove any tree in any situation. Tree Removal is recommended only when the tree is dead or dying, hazardous, causing obstruction, when new construction is involved, or when a replacement of a more suitable specimen is needed.

Tree Pruning

Advanced Tree, Inc. uses pruning methods such as Cosmetic and Hygienic to improve the natural shape of the trees. Dead, diseased, and broken wood can be removed at any time of the year. However, for general pruning the best time is in late winter or early spring just before growth begins.

Stump Removal

Enhancing your property's appearance is important. Our Stump Removal provides a less invasive and more cost efficient alternative to traditional stump removal. If you are tired of mowing around those aggravating stumps, we can help.

Hazardous Removals

Trees have a natural growth curve. Eventually, trees reach their genetic potential and at some point are affected by a number of damaging factors. Trees or parts of trees may fall causing personal or property damage. To determine if a tree is hazardous, request a FREE ESTIMATE from **Advanced Tree, Inc.**

View Enhancement

Keep the view and the tree. Our specialists will trim only what needs to be removed to maximize your view without harming the natural surroundings.

Tree Diseases

Infestation and various diseases such as Oak Wilt, Bark Beetle and Needle Blight are common to the area. Oak Wilt spread is a fungus moving from one infected tree to another through the connected root systems, killing trees and creating an infection center. The only cure is root grafts.

Bark Beetle disease is caused by beetles that are attracted to certain tree pheromones. Once these beetles lay spores into the cambium layer, the tree will die. In the fall, sap carries the pheromone down the tree to the root system and in the spring it is picked up again

by existing trees. The only cure for Bark Beetle disease is to remove the infected tree and apply boric acid to the stump.

Needle Blight infection is an iron deficiency caused by loss of nutrients from compacted yards. Trimming all dead wood, browning limbs, and adding cambium layer micro injections will help the tree regain health.

Please call for a FREE estimate or FREE consultation. ADV Tree is proud to have thousands of satisfied customers, not thousands of miscellaneous jobs.
